

# Healthy Waterways Strategy

Stormwater Victoria

May 2020

# Healthy Waterways Strategy

What's new.....

# HWS – what's new?

- First unified strategy (inclusive of wetlands, estuaries and stormwater) and **fully co-designed**
- increased **Traditional Owners and Aboriginal Victorians**
- **Urbanisation**: Harvest around 80 GL stormwater and infiltrate 20 GL (at full development)
- **Climate change**: Investigate options to increase **environmental water reserve** by 23 GL over next 10 years
- Targets for **wetlands and estuaries**
- Increased focus on **social values**

Increase **access** along waterways by 34 km.

**Environmental water** reserve is increased by 7 GL/year by 2028 (subject to Sustainable Water Strategy)

Progressively implement **stormwater harvesting**. Around 16.9 GL/year of stormwater harvested and 3.0 GL/year **infiltrated**, at full development (2050). Ensure DCI levels in priority catchments do not increase beyond current levels and headwater streams are retained as features in the landscape for environmental and social benefits.

Establish 435 km and maintain 648 km of continuous **vegetated buffers** along at least 80% of priority reaches.

**Wetlands:** Eg Implement key actions in the Ramsar Site Management Plan for significant wetlands and planning for climate change adaptation and resilience.

**Estuaries:** Eg Enhance estuarine vegetation condition and reduce threat of invasive plant species to significant estuarine vegetation.

## Werribee Catchment

Map at A4 Scale 1: 460,000

Sub-catchment boundary  
Township  
Existing urban  
Future urban

Rivers, Creeks and drains  
Wetland / Waterbody  
Parks & Reserves  
Stormwater priority areas

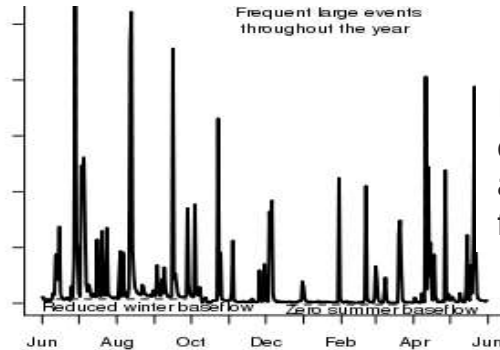

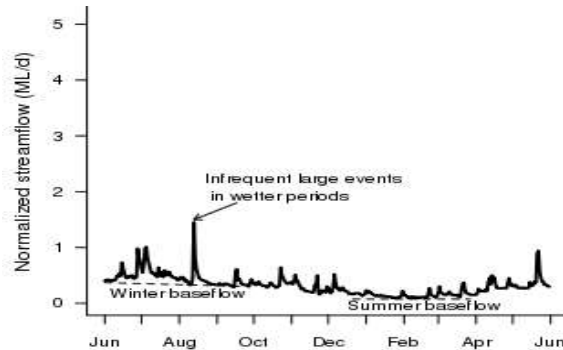

Veg. buffers to establish  
High Quality Veg. to maintain  
Fish Barrier to remove (over next 10 years)  
Fish Barrier to remove (over next 50 years)

# The stormwater problem

Olinda Creek –  
undeveloped catchment  
about 3% roads,  
footpaths and roofs

Brushy Creek –  
developed catchment  
about 20% roads,  
footpaths and roofs

# Management of the ecological impacts of urban land and activities on waterways

Issues Paper:  
understanding the science

2016

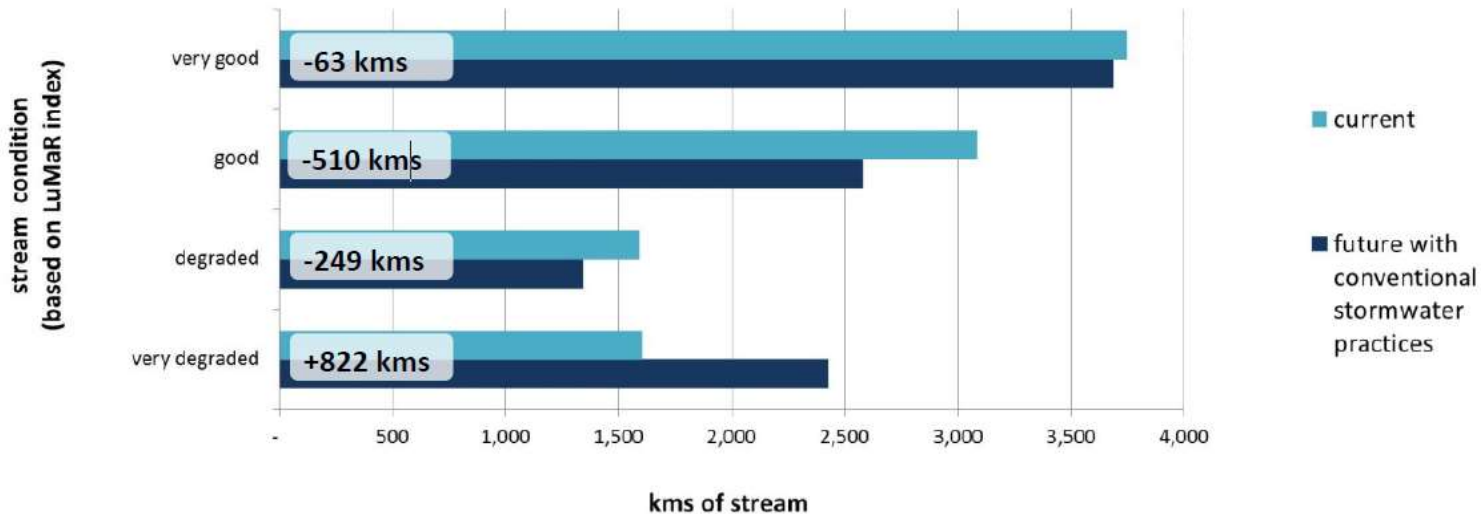

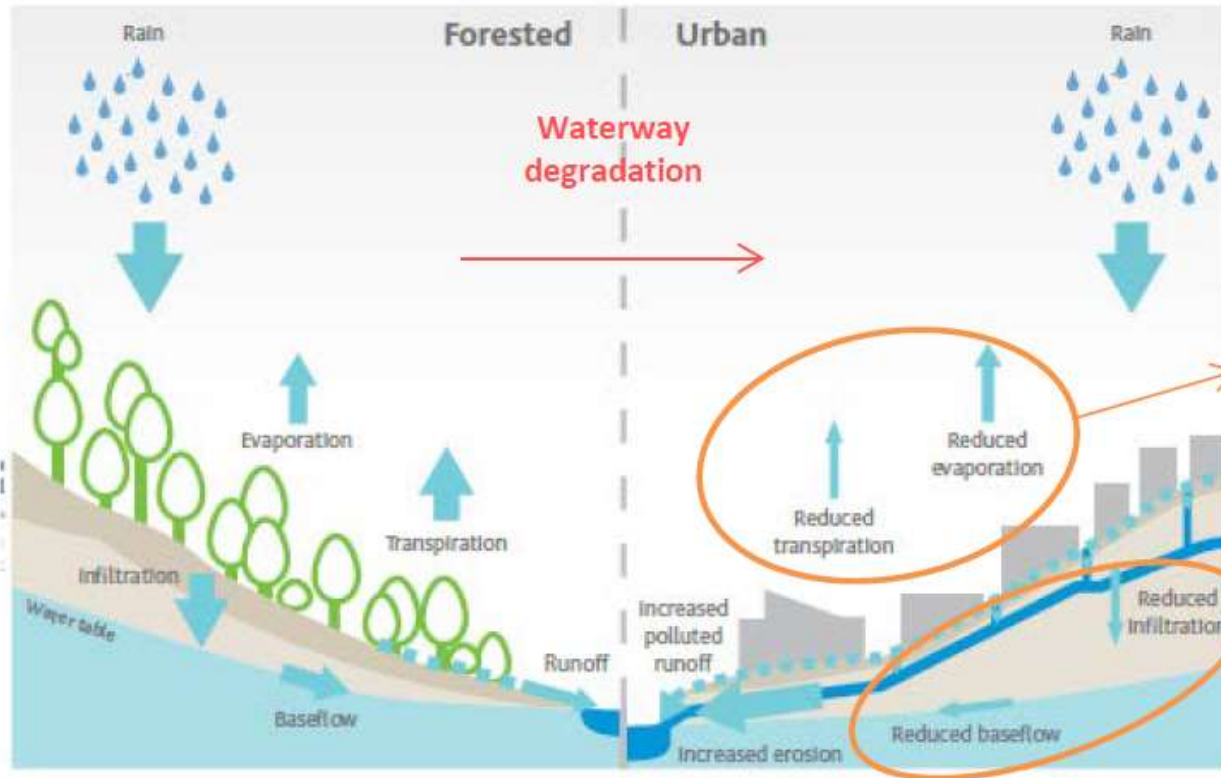

Figure 1. Evolution of stream condition estimated to 2030, shown as length of streams in each condition category (based on LUMAR macroinvertebrates assemblage index)

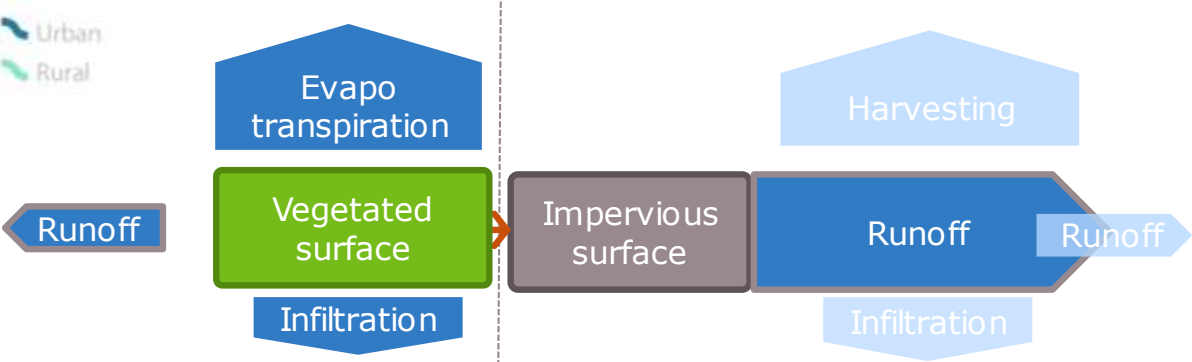

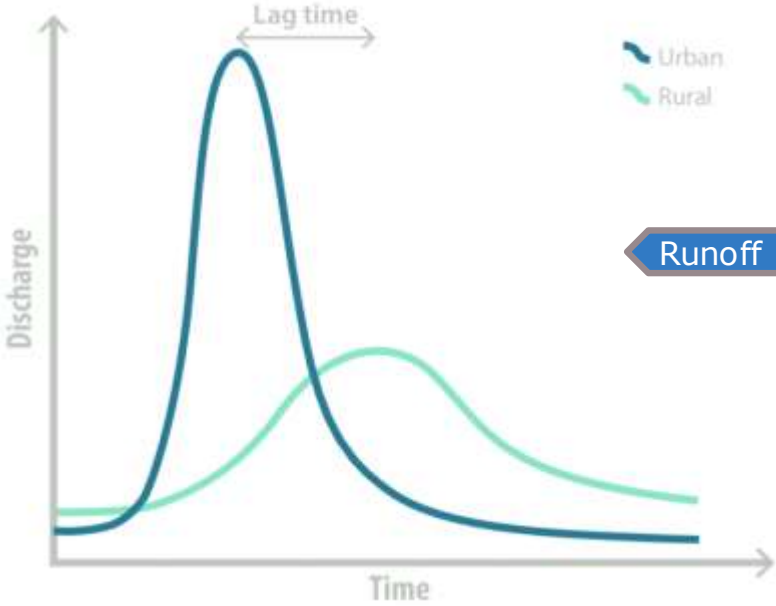

Strategies to mimic natural water regime

Use stormwater as alternative water supply, maximise vegetated areas

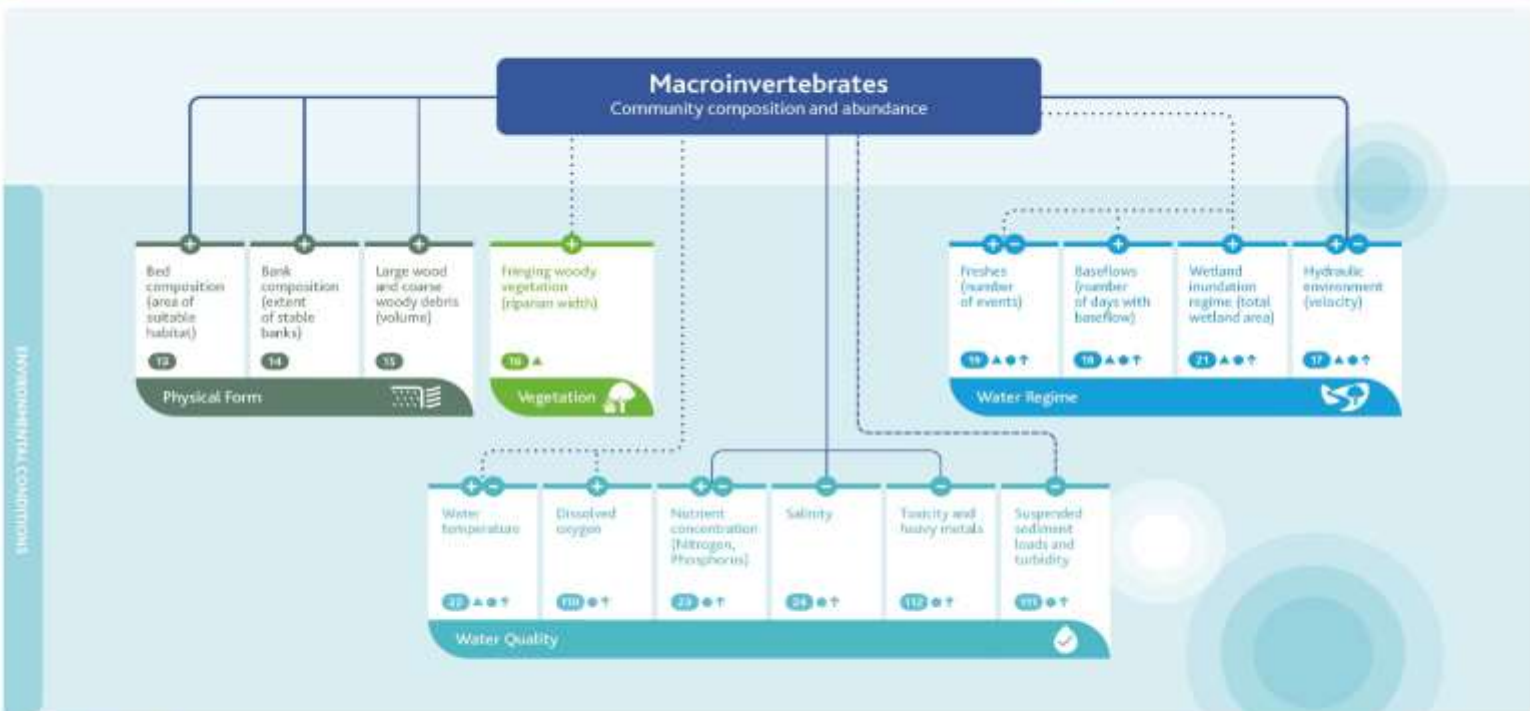

Infiltration through vegetated or non-vegetated systems

Figure 15. Comparison of the water balances of a forested catchment and an urban catchment (reproduced and adapted from (Melbourne Water, 2013) based on (Walsh, et al., 2004)

# Flow regime impacts

MANAGEMENT LEVELS

Foundational activities

Waterway management structures & operation

Vegetation management

Water licence and entitlement management

Agricultural and forestry runoff management

Urban stormwater and pollution management

Relationship strength (Strong or Moderate)  
Confidence (High or Medium)

Strong, High ———  
Strong, Medium - - - -  
Moderate, High ———  
Moderate, Medium - - - -

Indicative relationship direction\*

Positive (increase in condition will lead to increase in value)  
Negative (increase in condition will lead to decrease in value)

\* These general relationships typically apply within the bounds of thresholds

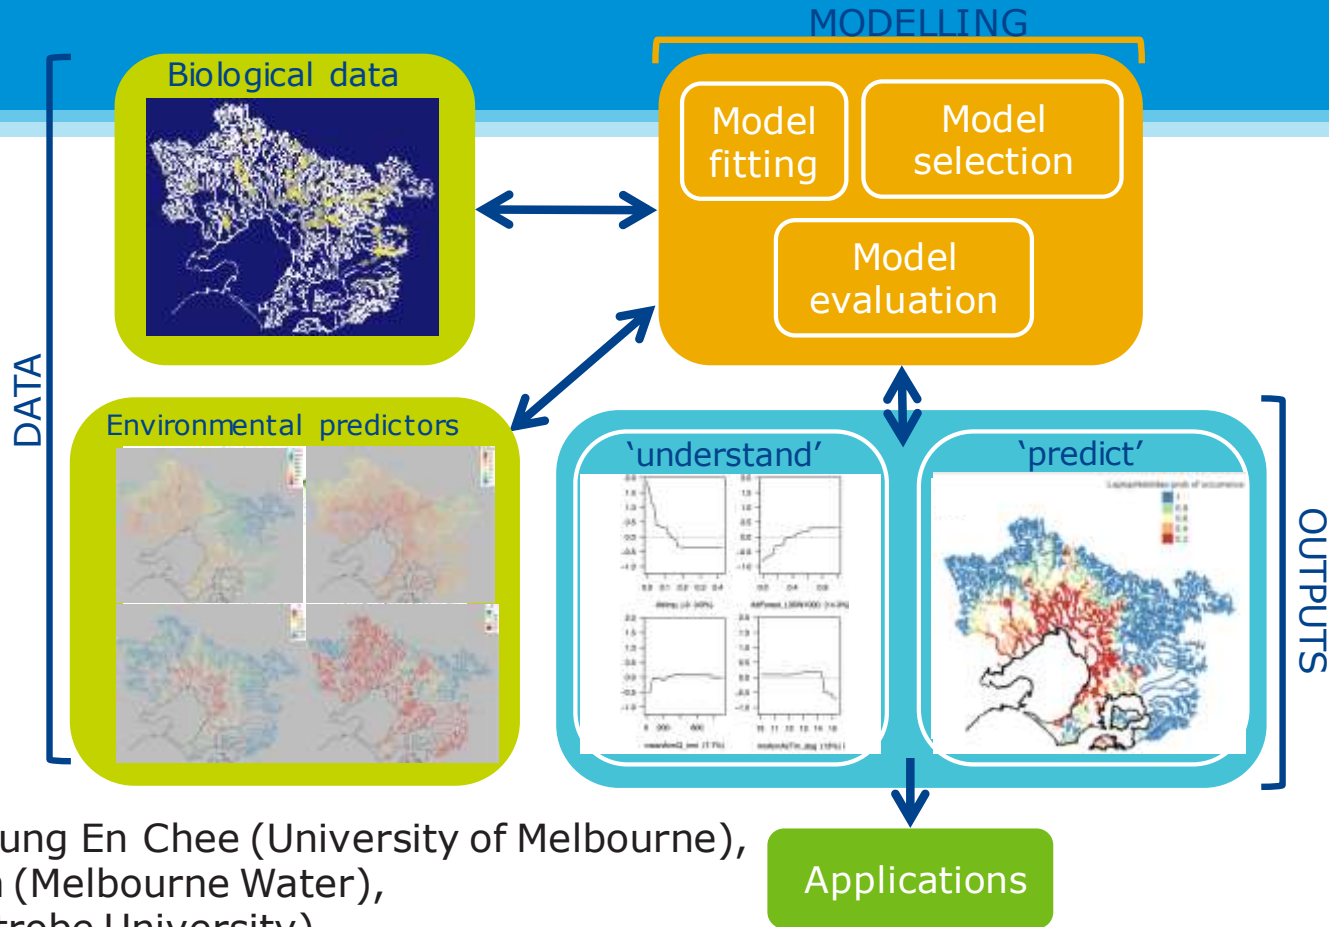

Relationship ID 100

Themes: + Sensitive to upstream catchment  
▲ Climate change  
● Urbanisation

Influence of management levels on environmental conditions

# Overview of the Habitat Suitability Modelling Process

Chris Walsh, Yung En Chee (University of Melbourne),  
Rhys Coleman (Melbourne Water),  
Nick Bond (Latrobe University)

# HSM scenario design

baseline

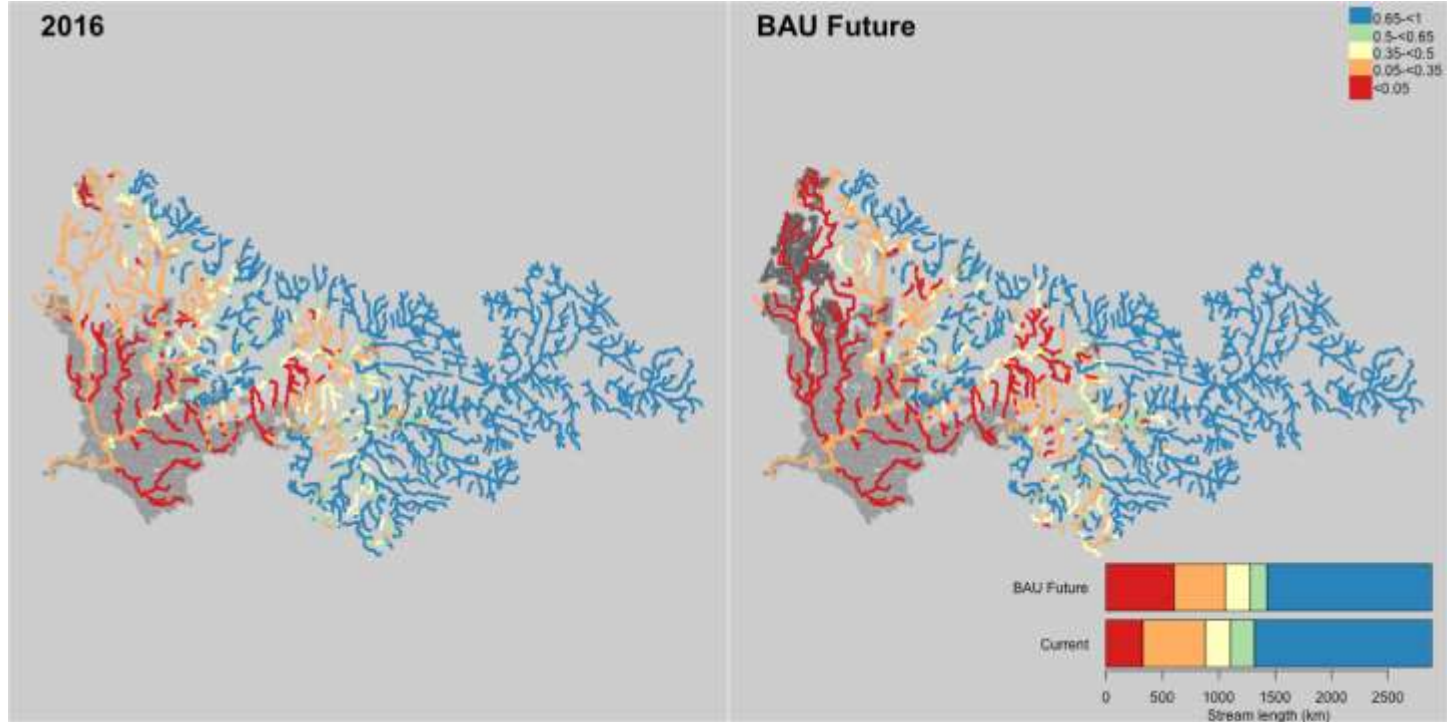

business  
as usual

scenarios

<b>Baseline</b>	2016 data
<b>Business as usual Future</b> <ul style="list-style-type: none"><li>• Climate change</li><li>• Future urbanisation</li><li>• No additional revegetation</li></ul>	1.5 degrees warmer 25% reduction in flows at mouth of Yarra Current UGB fully developed under current BPEM No changes to vegetation No changes to barriers or fishways
<b>Stormwater 1</b>	All future and existing stormwater impacts removed (ie DCI reduced to 0)
<b>Stormwater 2</b>	All future stormwater impacts removed (future DCI remains 0)
<b>Stormwater 3 – long term</b>	All greenfield + redevelopment treated – ie DCI reduced by 25%
<b>Revegetation 20m</b>	Assumes a continuous riparian buffer to 20m either side of waterway
<b>Revegetation 10m</b>	Used within the UGB due to limitations of getting 20m
<b>Fishway 1</b>	removal of mainstem barriers, excluding major dams

# Macroinvertebrates (Bugs) assessed using **LUMaR** – an **integrated index**

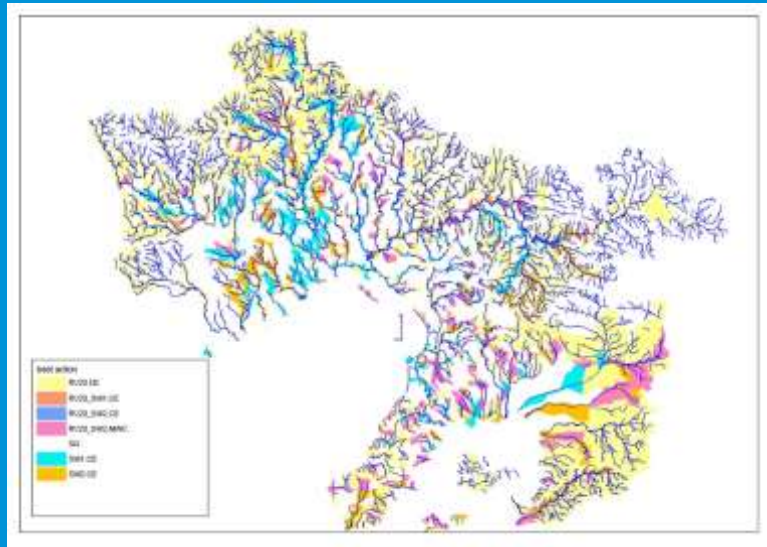

# Spatial prioritisation - zonation

- *Representativeness*
- *irreplaceability*
- *complementarity*

costs

Reveg only, reveg + SW, SW only

What action/s

Where to start first

# Making sense of model outputs

---

## Factors

Multiple high ranking reaches

Low levels of imperviousness

Prioritised small to medium sized catchments

Known good quality instream physical habitat

Rural townships - surrounding rural land / space

Existing commitments

Equity – having priorities in each of the 5 catchment

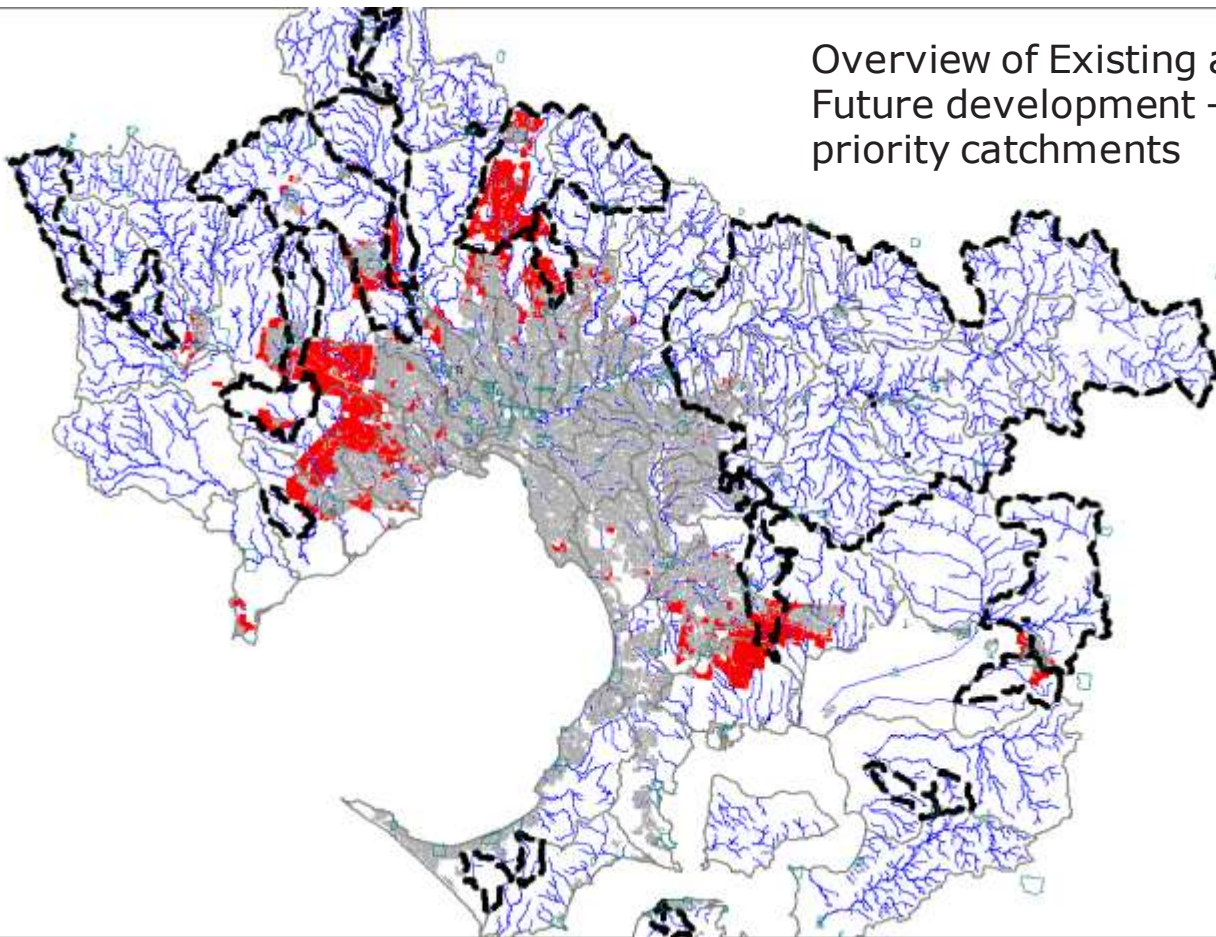

Protection of Platypus, listed species

Length of stream benefited

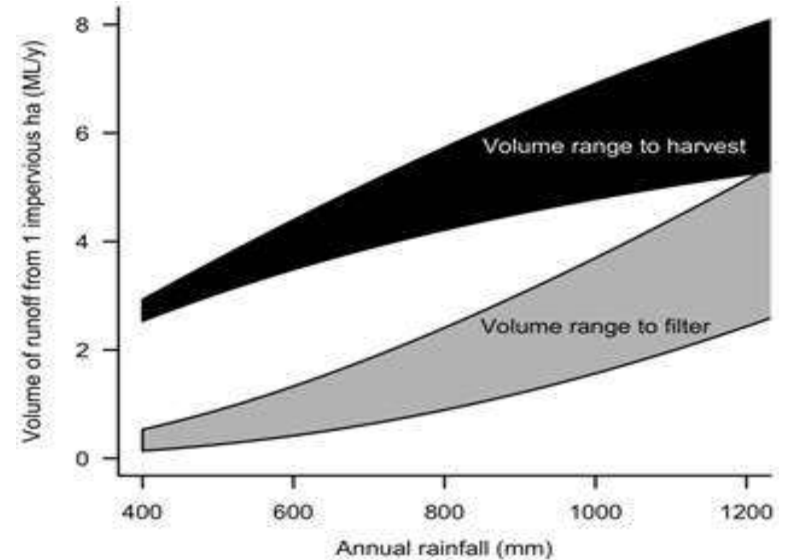

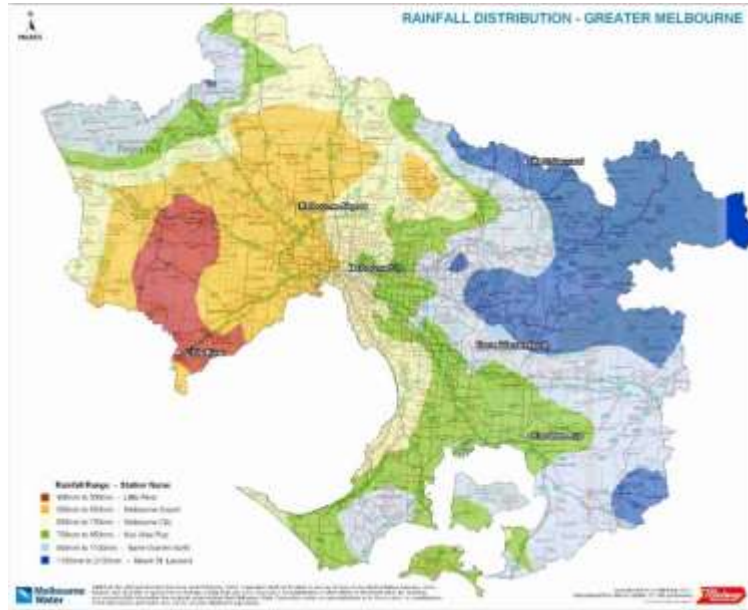

Supported by co-design

Overview of Existing and  
Future development +  
priority catchments

# Targets factor in rainfall

## Urban Stormwater Runoff: A New Class of Environmental Flow Problem (2012)

[Christopher J. Walsh](#), <sup>1, \*</sup> [Tim D. Fletcher](#), <sup>1, 2</sup> and [Matthew J. Burns](#) <sup>2</sup>

# Targets

***For every hectare of impervious area harvest around X GL/y and infiltrate X GL/y***

Harvest volumes (GL/y)

Infiltration volumes (GL/y)

# Draft MERI rubric

<b>Performance</b>	<b>Criteria</b>
<b>On-track</b>	<p>At least 90% of the annualised cumulative 10 year target is or will be treated to offset flows generated from new development</p> <p>Treatments need to be either constructed or have approved budget and concept or functional designs</p>
<b>Slightly off-track</b>	<p>Between 70 and 90% of the annualised cumulative 10 year target is or will be treated to offset flows generated from new development</p> <p>Treatments need to be either constructed or have approved budget and concept or functional designs</p>
<b>Majorly off-track</b>	<p>&lt; 70% of the annualised cumulative 10 year target is or will be treated to offset flows generated from new development</p> <p>Treatments need to be either constructed or have approved budget and concept or functional designs</p>

# Summary

- Developed stormwater targets from best available data, likely future scenarios etc.
- Combined modelled benefits and costings - balanced with pragmatism and good sense
- Used rainfall data rather than a single standard to determine volumes to harvest and infiltrate in a spatial way

**Place based targets that have sound rationale**

# Recent work that will help implementation

## **DELWP led**

IWM forums – KPI's linked to many HWS targets inc stormwater volumes

MUSICX review - E Water

STORM tool update to better model flows

MUSIA– Melb Urban Stormwater Institutional Arrangements

work has begun

Source model updates – E Water

## **MW led**

Prioritisation for MW investment – TAPS internal tool being developed to assess

MW funding bid developed with customers – stormwater

**EPA led** – developing new stormwater guidelines under the GED

# EnviroDevelopment Accreditation Scheme

1.1 - Performance table for water harvesting in Victoria:

Average Annual Rainfall (mm)	Volume to harvest as % of total impervious runoff volume
200	93%
300	88%
400	85%
500	77%
600	72%
700	68%
800	64%
900	60%
1000	56%
1100	53%
1200	50%
1300	48%
1400	46%
1500	44%
1600	42%
1700	40%
1800	38%
1900	37%
2000-2500	32%
2500-3000	28%
3000-3500	25%
3500-4000	22%

# Some of the recent projects that have been funded

- **Casey** - new dev street scape, stormwater harvesting
- **Yarra Ranges** - trialling new porous paving, small scale stormwater disconnection
- **Macedon Ranges** – Romsey WSUD investigation and concept plan
- Developing up a **new integrated incentives program** – aimed more at achieving Strategy outcomes than it has in the past

# It's a complex space
